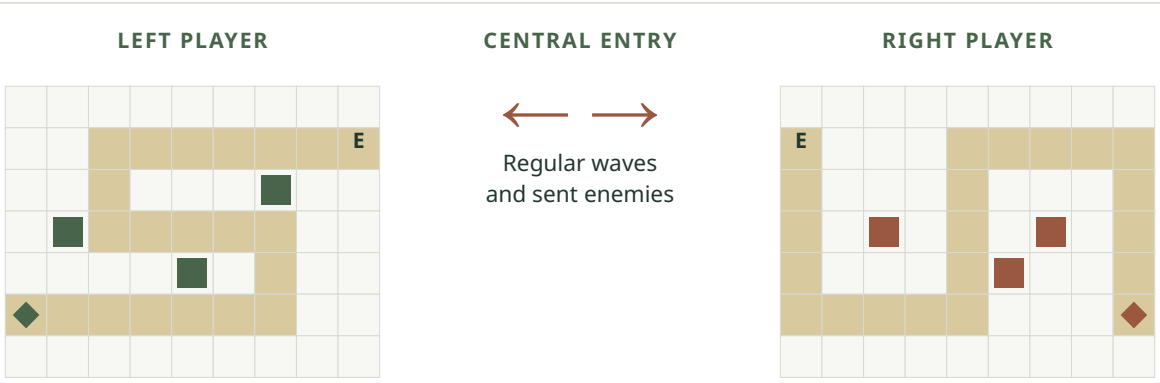
THE IDEA

Goorcs

A private 1v1 tower-defense game

You build an enemy route and defend it while sending extra enemies at a friend. Both players also face regular waves. The game uses top-down pixel art in a broad fantasy world, with orcs as its foundation.

A run starts with a small defense. The board expands as towers evolve into larger structures. Powerful spells and much denser enemy waves make late combat increasingly intense. The intended sessions are longer; their duration is still open.



E = entrance · Squares = towers · Diamond = proposed crystal base

Entrances and crystals stay fixed as maps grow. Layouts and art are illustrative.

Your sends join the opponent's stream. Each player designs a separate path.

A run at a glance

1 **Prepare a loadout**
Choose a limited set of tower types from your permanent collection. Your hero is an off-board commander.

2 **Build and fight**
Buy and improve towers during combat. Sending enemies costs currency and increases future income, competing with spending on your own defense.

3 **Develop the defense**
Buy upgrades and adapt to random rewards. Both your path allowance and the whole map grow at milestones.

4 **Finish the duel**
Enemies that reach a base damage it. Base health carries between rounds; destroying the opposing base wins the run.

PLAYING THE GAME

Building the defense

You lay the path

Both players begin with an equal budget of path tiles on a square grid. The tiles must connect the entrance to the base. Enemies take the **shortest route across connected tiles**, so joining two nearby sections can create a shortcut.

Towers use the same grid. Their placement must preserve the route. Some major upgrades need more space, so room for a larger tower is part of planning. Exact board dimensions and tile allowances are undecided.

During a wave	During planning breaks
Build, upgrade and sell towers. Use abilities on either board. Send enemies, scout, gamble, construct other buildings and interact with map features. The current route stays fixed.	Redesign the path and freely relocate existing towers while keeping their upgrades and traits. Break timing is still being decided.

Enemy sends and spells

Purchased enemies arrive throughout combat in an independent, paced stream alongside regular spawns. Planning orders wait for combat. Both boards finish all deliveries and living enemies before the break.

Spells aimed at the opponent cause temporary disruption. They cannot permanently destroy towers or directly damage the base.

Known towers, different results

You buy a chosen tower type from your loadout. Its bonuses are randomized, with both stat changes and traits that can change how it works with the rest of your defense. When those bonuses become visible is still open.

Tower growth combines ordinary levels with major branching evolutions. An evolution can change the tower’s role and appearance, and sometimes its footprint. Buying individual upgrades is the chosen system; duplicate merging is outside the current plan.

Gambling has several risk levels

Possible activities include paying for another bonus roll, wagering currency for a random reward, or risking a tower for a transformation. We want several kinds of gambling, but the exact activities, odds and losses are still open. These use game resources. No real-money gambling is planned.

What survives a run

Earn currency for random collection draws and permanent upgrades. Your collection unlocks more tower options and some lasting stat changes. Run-specific towers, bonuses and perks reset. How wins and losses affect the payout still needs a decision.

DECISIONS FOR US

What is still open

The direction above describes the planned game. The choices below still need discussion or playtesting.

Commanders and maps

Commanders stay off the battlefield. Most defenses are physical structures, such as towers and other buildings. We want maps with meaningful mechanical differences. There are two possible ways to connect them to commanders:

Commander-linked boards
Your commander determines or changes parts of the board, such as special zones or expansion behavior.

Independent choices
Choose a commander and map separately. Each has its own mechanics, allowing different combinations.

Matching starting boards with different player-built paths also remain possible. We have not chosen a final rule for board symmetry.

The shape of a long run

The current preference is to keep the same maze and towers across rounds. That would let a defense develop over several encounters. This remains provisional.

Planning could use a fixed timer, a ready button that starts a short countdown for the other player, or a mixture. Neither the timing nor the number of waves per round is fixed. The earlier examples of 30 path tiles and a 30-second countdown were suggestions.

What needs concrete rules next

Economy and progression

Starting funds, income growth, sale refunds and permanent stat advantages need limits. Early luck or collection strength should be considered when balancing a match.

Abilities and content

We need tower branches, enemy counters and actual spells. Offensive abilities need readable effects and rules for how the opponent can respond.

Where the project stands

The Godot prototype connects two players by invite and synchronizes their boards. Both-ready locks routes for escalating waves. Coins pay for three tower types, damage/speed upgrades and partial-refund selling. Tower menus show kills and targeting; Rune uses a short-range area pulse. Paid enemy sends use independent streams and add recurring clear income. Loadouts and full progression remain planned. Local workshop and collection chests are also playable.

First playable: connect two boards with one tower type and one enemy type. Prove the path rules, live building and upgrades, selling, income from sends, and base defeat before adding the collection and larger content roster.

Source: docs/game-direction.md. The competitive prototype includes shared mazes, combat, Coins and tower management; the full match design remains planned.
